## Big Data Analytics

Introduction

1

## Theme of this Course

Large-Scale Data Management

Big Data Analytics

#### Data Science and Analytics

 How to manage very large amounts of data and extract value and knowledge from them

## Introduction to Big Data

What is Big Data?

What makes data, "Big" Data?

## Big Data Definition

• No single standard definition...

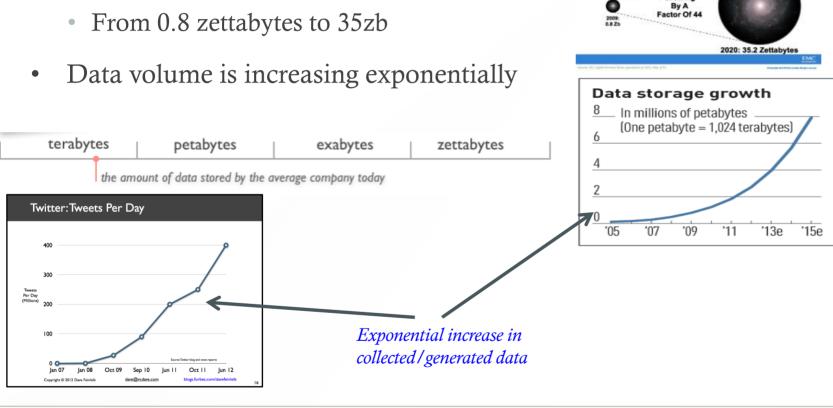

"Big Data" is data whose scale, diversity, and complexity require new architecture, techniques, algorithms, and analytics to manage it and extract value and hidden knowledge from it...

## Characteristics of Big Data: 1-Scale (Volume)

The Digital Universe 2009-2020

#### Data Volume

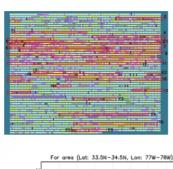

- 44x increase from 2009 2020

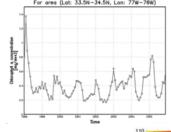

# Characteristics of Big Data: 2-Complexity (Varity)

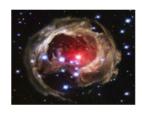

- Various formats, types, and structures
- Text, numerical, images, audio, video, sequences, time series, social media data, multi-dim arrays, etc...
- Static data vs. streaming data
- A single application can be

To extract knowledge → all these types of data need to linked together

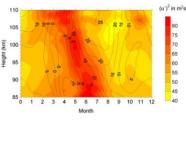

# Characteristics of Big Data: 3-Speed (Velocity)

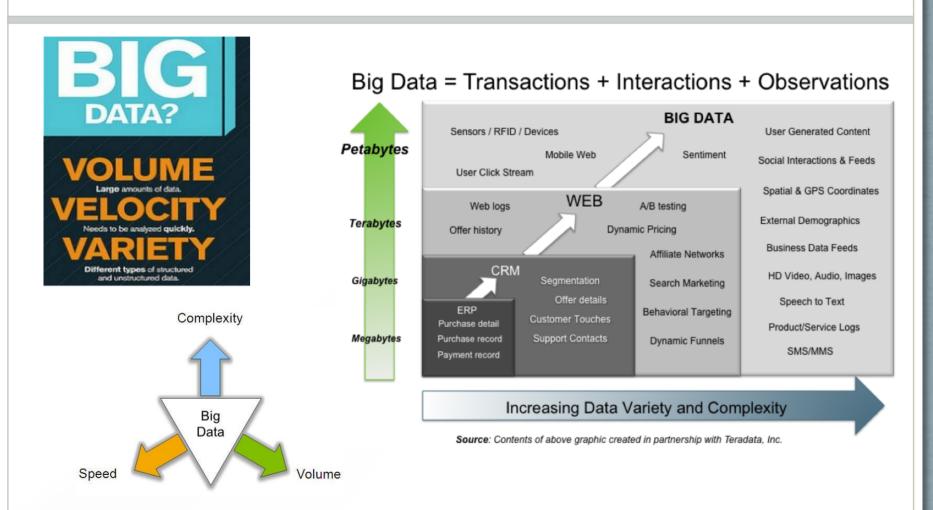

- Data is begin generated fast and need to be processed fast
- Online Data Analytics
- Late decisions **\rightarrow** missing opportunities

#### Examples

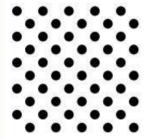

- **E-Promotions:** Based on your current location, your purchase history, what you like → send promotions right now for store next to you
- **Healthcare monitoring:** sensors monitoring your activities and body → any abnormal measurements require immediate reaction

## Big Data: 3V's

## Some Make it 4V's

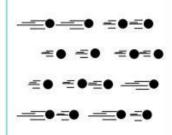

#### Volume

#### Data at Rest

Terabytes to exabytes of existing data to process

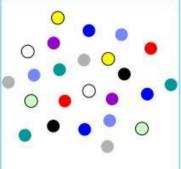

#### Velocity

#### Data in Motion

Streaming data, milliseconds to seconds to respond

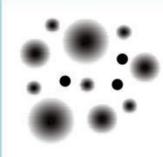

#### Variety

#### Data in Many Forms

Structured, unstructured, text, multimedia

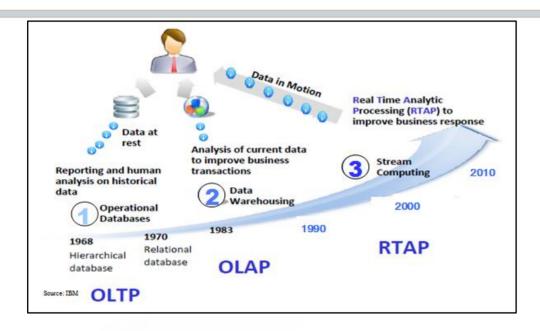

#### Veracity\*

#### Data in Doubt

Uncertainty due to data inconsistency & incompleteness, ambiguities, latency, deception, model approximations

## Harnessing Big Data

- **OLTP:** Online Transaction Processing (DBMSs)
- **OLAP:** Online Analytical Processing (Data Warehousing)
- RTAP: Real-Time Analytics Processing (Big Data Architecture & technology)

## Who's Generating Big Data

**Social media and networks** (all of us are generating data)

**Scientific instruments** (collecting all sorts of data)

Mobile devices (tracking all objects all the time)

Sensor technology and networks (measuring all kinds of data)

- The progress and innovation is no longer hindered by the ability to collect data
- But, by the ability to manage, analyze, summarize, visualize, and discover knowledge from the collected data in a timely manner and in a scalable fashion

## The Model Has Changed...

• The Model of Generating/Consuming Data has Changed

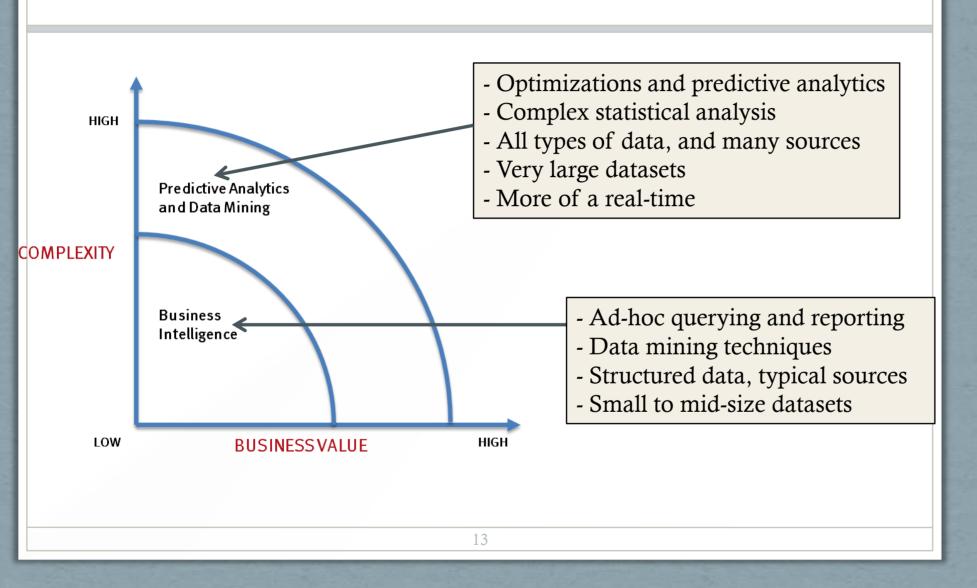

Old Model: Few companies are generating data, all others are consuming data

New Model: all of us are generating data, and all of us are consuming data

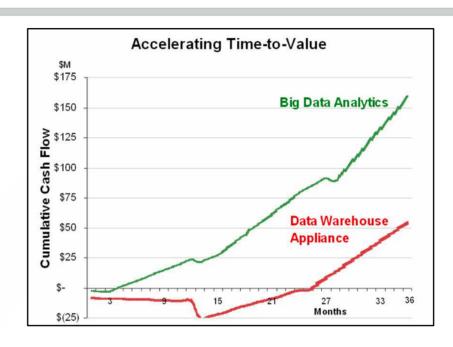

## What's driving Big Data

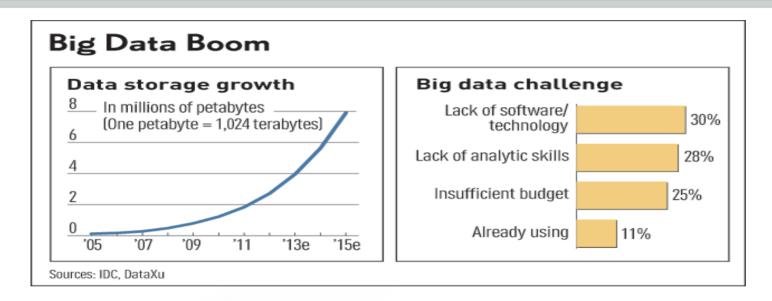

## Value of Big Data Analytics

- Big data is more real-time in nature than traditional DW applications
- Traditional DW architectures (e.g. Exadata, Teradata) are not well-suited for big data apps
- Shared nothing, massively parallel processing, scale out architectures are well-suited for big data apps

## Challenges in Handling Big Data

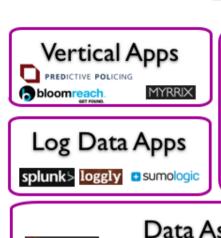

#### The Bottleneck is in technology

- New architecture, algorithms, techniques are needed
- Also in technical skills
  - Experts in using the new technology and dealing with big data

# What Technology Do We Have For Big Data ??

16

## Big Data Landscape

## Analytics and Visualization

#### Operational Infrastructure

#### Infrastructure As A Service

## Structured Databases

#### **Technologies**

## Big Data Technology

## What You Will Learn...

- We focus on *Hadoop/MapReduce technology*
- Learn the platform (how it is designed and works)
  - How big data are managed in a scalable, efficient way
- Learn writing Hadoop jobs in different languages
  - Programming Languages: Java, C, Python
  - High-Level Languages: Apache Pig, Hive
- Learn advanced analytics tools on top of Hadoop
  - RHadoop: Statistical tools for managing big data
  - Mahout: Data mining and machine learning tools over big data
- Learn state-of-art technology from recent research papers
  - Optimizations, indexing techniques, and other extensions to Hadoop

## Course Logistics

## Course Logistics

- Web Page: <a href="http://web.cs.wpi.edu/~cs525/s13-MYE/">http://web.cs.wpi.edu/~cs525/s13-MYE/</a>
- Electronic WPI system: blackboard.wpi.edu
- Lectures
  - Tuesday, Thursday: (4:00pm 5:20pm)

## Textbook & Reading List

#### No specific textbook

• Big Data is a relatively new topic (so no fixed syllabus)

#### Reading List

- We will cover the state-of-art technology from research papers in big conferences
- Many Hadoop-related papers are available on the course website

#### Related books:

• Hadoop, The Definitive Guide [pdf]

## Requirements & Grading

#### • Seminar-Type Course

• Students will read research papers and present them (<u>Reading List</u>)

#### • Hands-on Course

- No written homework or exams
- Several coding projects covering the entire semester

Done in teams of two

#### Course grades are divided as follows:

Item	Percentage	Notes
Projects (6 or 7)	50%	Each project will be done in teams of two.
Presentations (1 or 2)	25%	Each presentation will be done in teams of two. If the number of teams is large, some teams may do one presentation + an extra project.
Reviews	15%	Reviews are done individually. Whenever a team is presenting a paper, other students are expected to read the presented paper and submit a review on it.
Class Participation	10%	Includes discussions in class and attendance.

## Requirements & Grading (Cont'd)

#### Reviews

- When a team is presenting (*not the instructor*), the other students should prepare a review on the presented paper
- Course website gives guidelines on how to make good reviews
- Reviews are done individually

#### Course grades are divided as follows:

Item	Percentage	Notes
Projects (6 or 7)	50%	Each project will be done in teams of two.
Presentations (1 or 2)	I .	Each presentation will be done in teams of two. If the number of teams is large, some teams may do one presentation + an extra project.
Reviews	I .	Reviews are done individually. Whenever a team is presenting a paper, other students are expected to read the presented paper and submit a review on it.
Class Participation	10%	Includes discussions in class and attendance.

## Late Submission Policy

#### For Projects

- One-day late  $\rightarrow$  10% off the max grade
- Two-day late  $\rightarrow$  20% off the max grade
- Three-day late  $\rightarrow$  30% off the max grade
- Beyond that, no late submission is accepted

#### • Submissions:

- Submitted via blackboard system by the due date
- Demonstrated to the instructor within the week after

#### For Reviews

- No late submissions
- Student may skip at most 4 reviews
- Submissions:
  - Given to the instructor at the beginning of class

## More about Projects

- A virtual machine is created including the needed platform for the projects
  - Ubuntu OS (Version 12.10)
  - Hadoop platform (Version 1.1.0)
  - Apache Pig (Version 0.10.0)
  - Mahout library (Version 0.7)
  - Rhadoop
  - In addition to other software packages
- Download it from the course website (link)
  - Username and password will be sent to you
- Need Virtual Box (Vbox) [free]

## Next Step from You...

- 1. Form teams of two
- 2. Visit the course website (<u>Reading List</u>), each team selects its first paper to present (1<sup>st</sup> come 1<sup>st</sup> served)
  - Send me your choices top 2/3 choices
- 3. You have until Jan 20th
  - Otherwise, I'll randomly form teams and assign papers
- 4. Use Blackboard "Discussion" forum for posts or for searching for teammates

## Course Output: What You Will Learn...

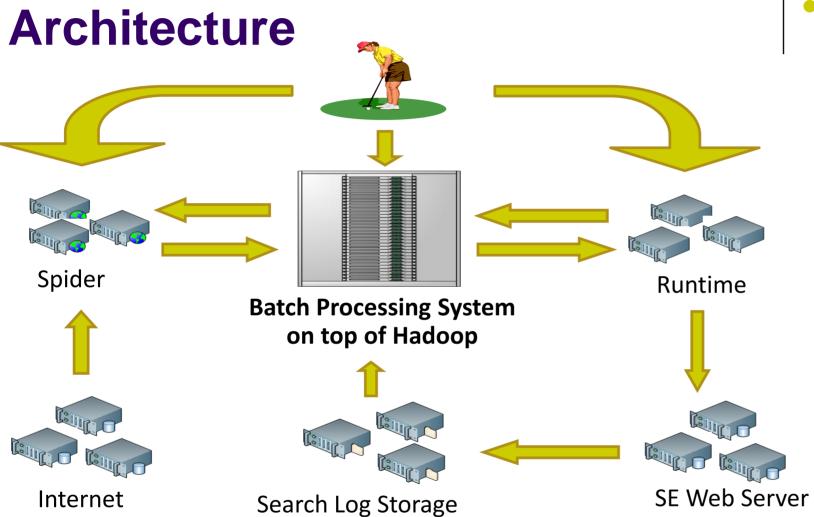

- We focus on *Hadoop/MapReduce technology*
- Learn the platform (how it is designed and works)
  - How big data are managed in a scalable, efficient way
- Learn writing Hadoop jobs in different languages
  - Programming Languages: Java, C, Python
  - High-Level Languages: Apache Pig, Hive
- Learn advanced analytics tools on top of Hadoop
  - RHadoop: Statistical tools for managing big data
  - Mahout: Analytics and data mining tools over big data
- Learn state-of-art technology from recent research papers
  - Optimizations, indexing techniques, and other extensions to Hadoop

#### **Open Source World's Solution**

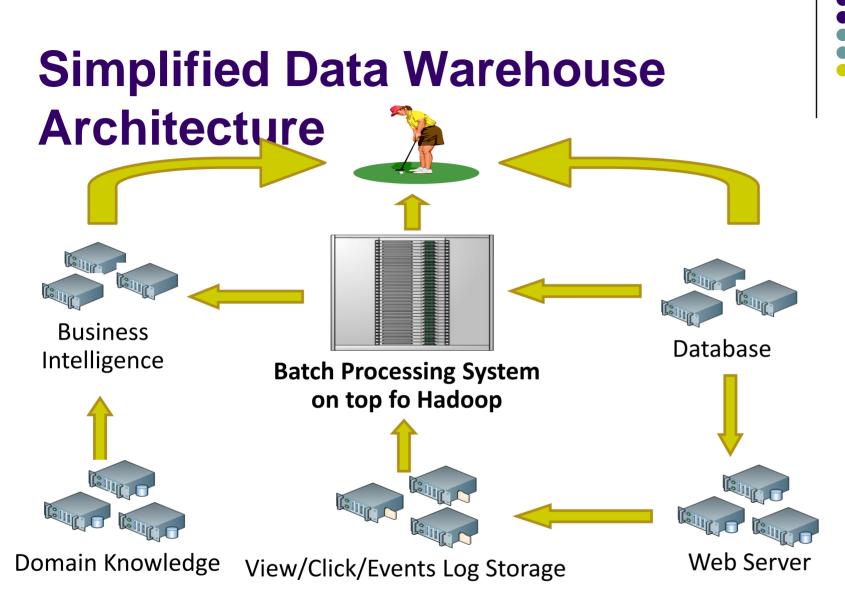

- Google File System Hadoop Distributed FS
- Map-Reduce Hadoop Map-Reduce
- Sawzall Pig, Hive, JAQL
- Big Table Hadoop HBase, Cassandra
- Chubby Zookeeper

Simplified Search Engine

## **Hadoop History**

- Jan 2006 Doug Cutting joins Yahoo
- Feb 2006 Hadoop splits out of Nutch and Yahoo starts using it.
- Dec 2006 Yahoo creating 100-node Webmap with Hadoop
- Apr 2007 Yahoo on 1000-node cluster
- Jan 2008 Hadoop made a top-level Apache project
- Dec 2007 Yahoo creating 1000-node Webmap with Hadoop
- Sep 2008 Hive added to Hadoop as a contrib project

## **Hadoop Introduction**

#### Open Source Apache Project

- http://hadoop.apache.org/
- Book: <a href="http://oreilly.com/catalog/9780596521998/index.html">http://oreilly.com/catalog/9780596521998/index.html</a>

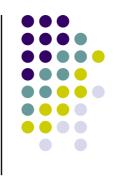

#### Written in Java

Does work with other languages

#### Runs on

- Linux, Windows and more
- Commodity hardware with high failure rate

#### **Current Status of Hadoop**

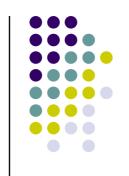

- Largest Cluster
  - 2000 nodes (8 cores, 4TB disk)
- Used by 40+ companies / universities over the world
  - Yahoo, Facebook, etc
  - Cloud Computing Donation from Google and IBM
- Startup focusing on providing services for hadoop
  - Cloudera

#### **Hadoop Components**

- Hadoop Distributed File System (HDFS)
- Hadoop Map-Reduce
- Contributes
  - Hadoop Streaming
  - Pig / JAQL / Hive
  - HBase
  - Hama / Mahout

## Hadoop Distributed File System

#### **Goals of HDFS**

10K nodes, 100 million files, 10 PB

#### Convenient Cluster Management

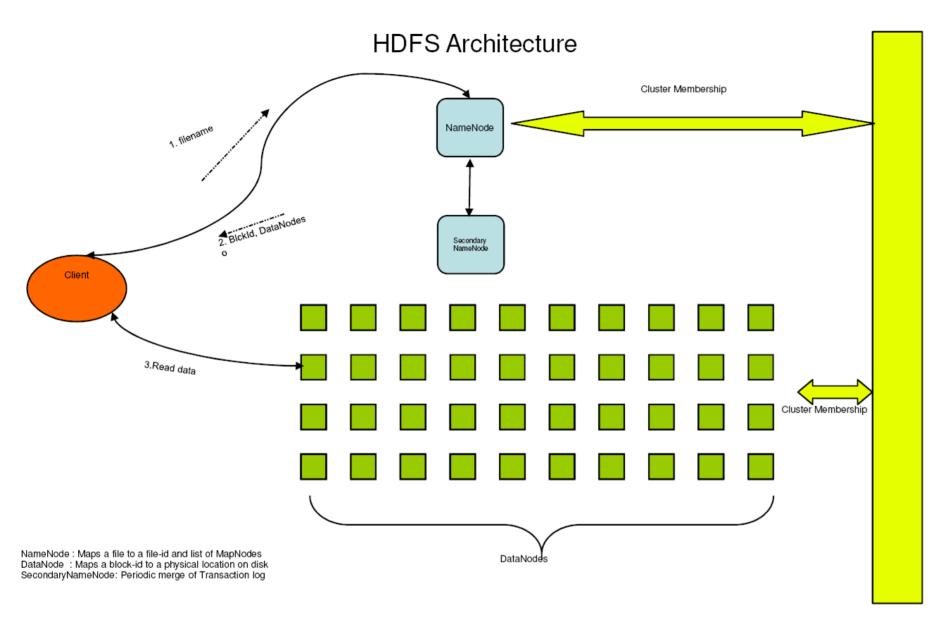

- Load balancing
- Node failures
- Cluster expansion

#### Optimized for Batch Processing

- Allow move computation to data
- Maximize throughput

#### **HDFS Details**

#### Data Coherency

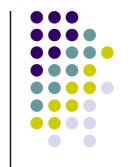

- Write-once-read-many access model
- Client can only append to existing files

#### Files are broken up into blocks

- Typically 128 MB block size
- Each block replicated on multiple DataNodes

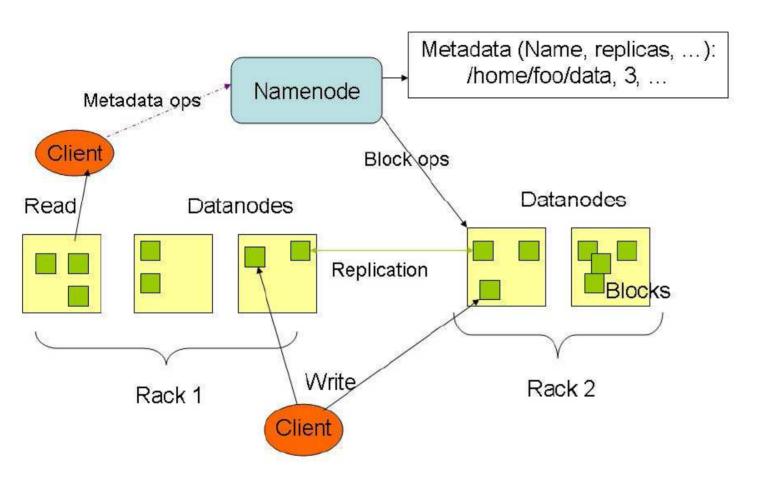

#### Intelligent Client

- Client can find location of blocks
- Client accesses data directly from DataNode

#### **HDFS** Architecture

#### **HDFS** User Interface

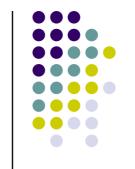

#### Command Line

- hadoop dfs -mkdir /foodir
- hadoop dfs -cat /foodir/myfile.txt
- hadoop dfs -rm /foodir myfile.txt
- hadoop dfsadmin -report
- hadoop dfsadmin -decommission datanodename

#### Web Interface

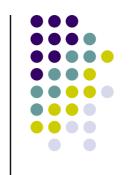

http://host:port/dfshealth.jsp

#### **More about HDFS**

- http://hadoop.apache.org/core/docs/current/hdfs\_design.html
- Hadoop FileSystem API
  - HDFS
  - Local File System
  - Kosmos File System (KFS)
  - Amazon S3 File System

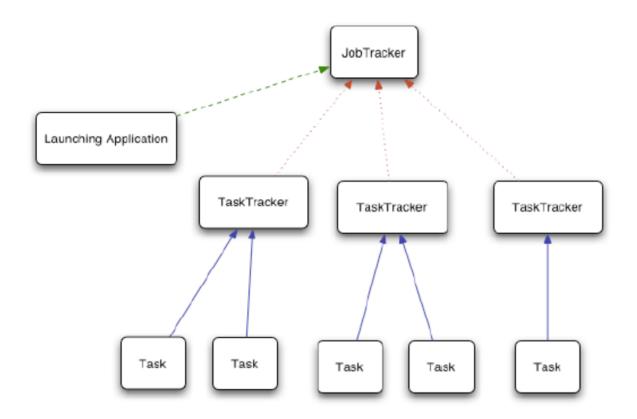

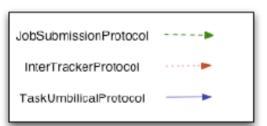

# Hadoop Map-Reduce and Hadoop Streaming

# **Hadoop Map-Reduce Introduction**

- Map/Reduce works like a parallel Unix pipeline:
  - cat input | grep | sort | uniq -c | cat > output
  - Input | Map | Shuffle & Sort | Reduce | Output
- Framework does inter-node communication
  - Failure recovery, consistency etc
  - Load balancing, scalability etc
- Fits a lot of batch processing applications
  - Log processing
  - Web index building

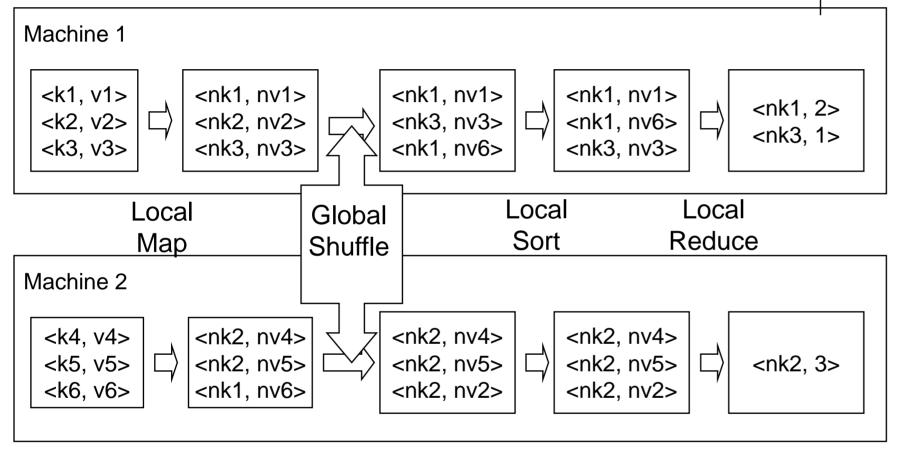

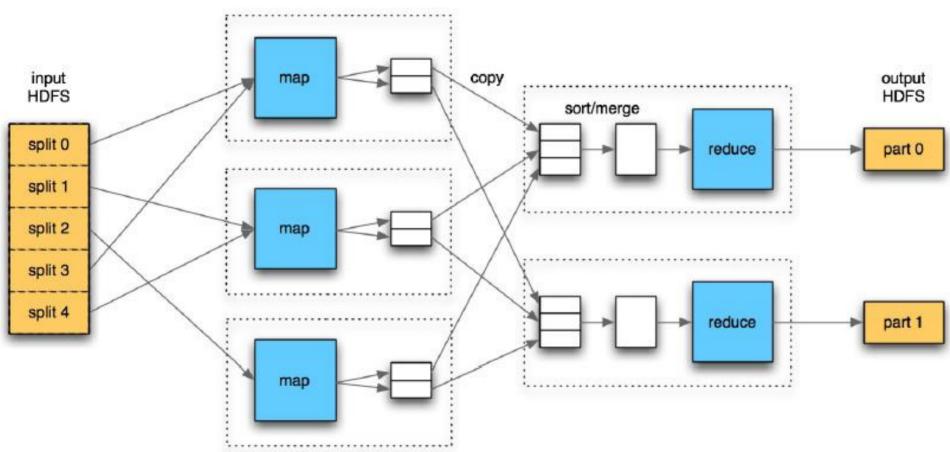

# **Physical Flow**

# **Example Code**

```
public void map(LongWritable key, Text val,
   OutputCollector<Text, IntWritable> output,
    Reporter reporter) throws IOException {
 if (pattern.matcher(val.toString()).matches()) {
   output.collect(val, new IntWritable(1));
public void reduce(Text key, Iterator<IntWritable> vals,
   OutputCollector<Text, IntWritable> output,
   Reporter reporter) throws IOException {
 int sum = 0;
 while (vals.hasNext()) {
    sum += vals.next().get();
 output.collect(key, new IntWritable(sum));
```

# **Hadoop Streaming**

- Allow to write Map and Reduce functions in any languages
  - Hadoop Map/Reduce only accepts Java
- Example: Word Count
  - hadoop streaming
    - -input /user/zshao/articles
    - -mapper 'tr " " "\n""
    - -reducer 'uniq -c'
    - -output /user/zshao/
    - -numReduceTasks 32

# **Example: Log Processing**

- Generate #pageview and #distinct users for each page each day
  - Input: timestamp url userid
- Generate the number of page views
  - Map: emit < <date(timestamp), url>, 1>
  - Reduce: add up the values for each row
- Generate the number of distinct users
  - Map: emit < <date(timestamp), url, userid>, 1>
  - Reduce: For the set of rows with the same
     <date(timestamp), url>, count the number of distinct users by "uniq –c"

# **Example: Page Rank**

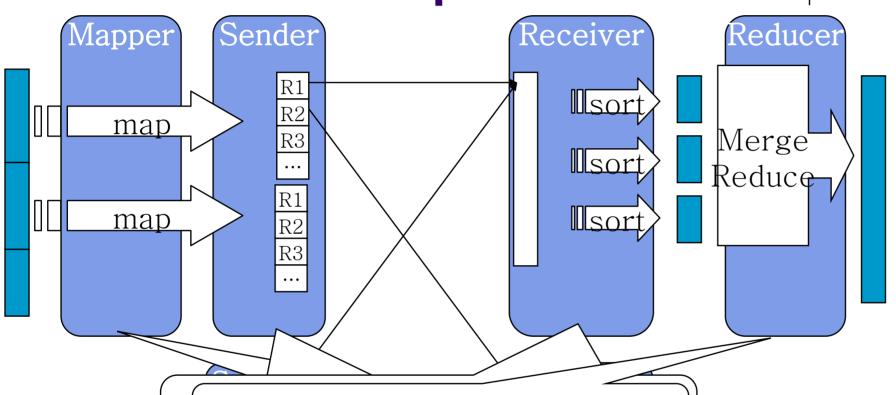

- In each Map/Reduce Job:
  - Map: emit <link, eigenvalue(url)/#links>
    for each input: <url, <eigenvalue, vector<link>> >
  - Reduce: add all values up for each link, to generate the new eigenvalue for that link.
- Run 50 map/reduce jobs till the eigenvalues are stable.

# TODO: Split Job Scheduler and Map-Reduce

- Allow easy plug-in of different scheduling algorithms
  - Scheduling based on job priority, size, etc
  - Scheduling for CPU, disk, memory, network bandwidth
  - Preemptive scheduling
- Allow to run MPI or other jobs on the same cluster
  - PageRank is best done with MPI

# **TODO:** Faster Map-Reduce

Reducer calls user functions:

Compare and Reduce outter to disk, and do checkpointing

# MapReduce and Hadoop Distributed File System

**(54)** 

CCSCNE 2009 Palttsburg, April 24 2009

### The Context: Big-data

- Man on the moon with 32KB (1969); my laptop had 2GB RAM (2009)
- Google collects 270PB data in a month (2007), 20000PB a day (2008)
- 2010 census data is expected to be a huge gold mine of information
- Data mining huge amounts of data collected in a wide range of domains from astronomy to healthcare has become essential for planning and performance.
- We are in a knowledge economy.
  - Data is an important asset to any organization
  - Discovery of knowledge; Enabling discovery; annotation of data
- We are looking at newer
  - o programming models, and
  - Supporting algorithms and data structures.
- NSF refers to it as "data-intensive computing" and industry calls it "big-data" and "cloud computing"

CCSCNE 2009 Palttsburg, April 24 2009

## Purpose of this talk

- (56)
- To provide a simple introduction to:
  - o "The big-data computing": An important advancement that has a potential to impact significantly the CS and undergraduate curriculum.
  - A programming model called MapReduce for processing "big-data"
  - A supporting file system called Hadoop Distributed File System (HDFS)
- To encourage educators to explore ways to infuse relevant concepts of this emerging area into their curriculum.

#### The Outline

- Introduction to MapReduce
- From CS Foundation to MapReduce
- MapReduce programming model
- Hadoop Distributed File System
- Relevance to Undergraduate Curriculum
- Demo (Internet access needed)
- Our experience with the framework
- Summary
- References

# MapReduce

CCSCNE 2009 Palttsburg, April 24 2009

# What is MapReduce?

- MapReduce is a programming model Google has used successfully is processing its "big-data" sets (~ 20000 peta bytes per day)
  - Users specify the computation in terms of a map and a reduce function,
  - Underlying runtime system automatically parallelizes the computation across large-scale clusters of machines, and
  - Underlying system also handles machine failures, efficient communications, and performance issues.
  - -- Reference: Dean, J. and Ghemawat, S. 2008. **MapReduce: simplified data processing on large clusters.** *Communication of ACM* 51, 1 (Jan. 2008), 107-113.

# From CS Foundations to MapReduce

60

Consider a large data collection:

{web, weed, green, sun, moon, land, part, web, green,...}

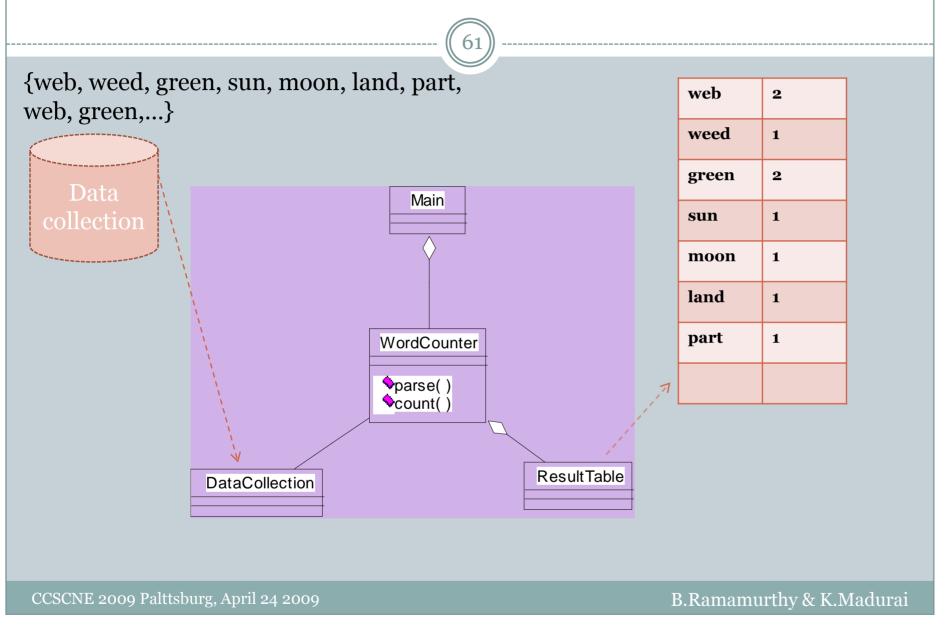

Problem: Count the occurrences of the different words in the collection.

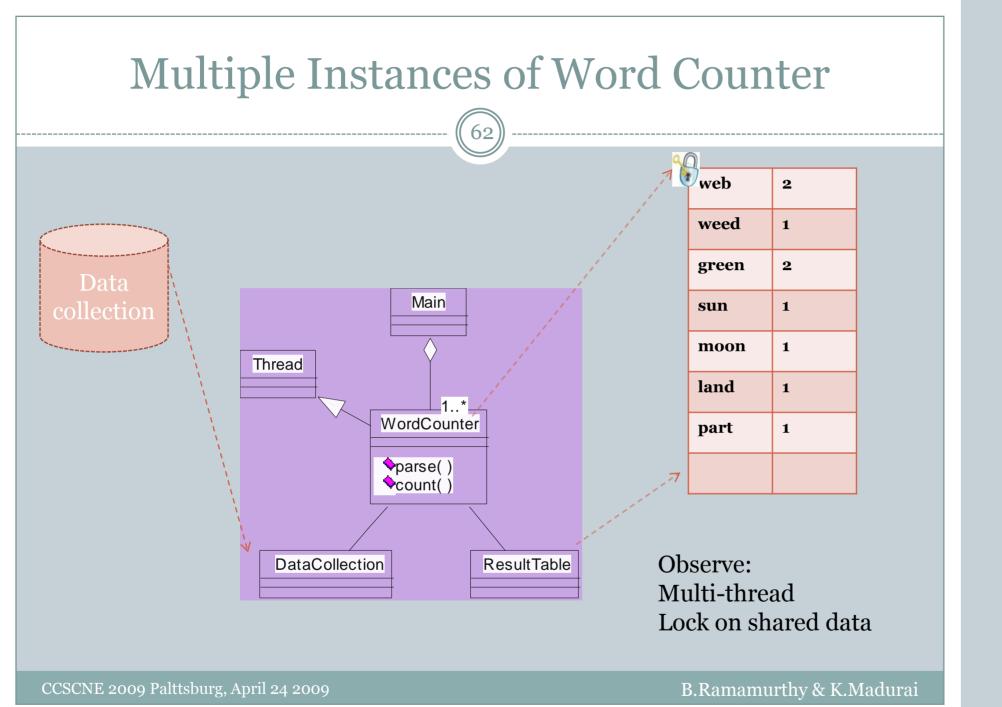

#### Lets design a solution for this problem;

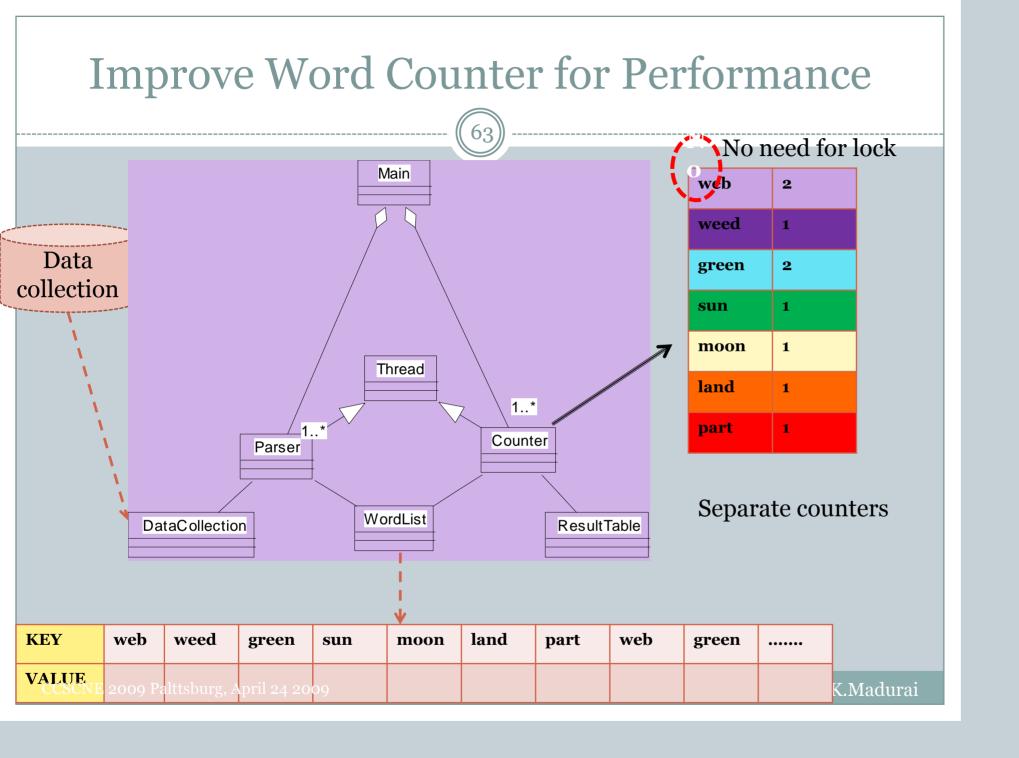

- We will start from scratch
- We will add and relax constraints
- We will do incremental design, improving the solution for performance and scalability

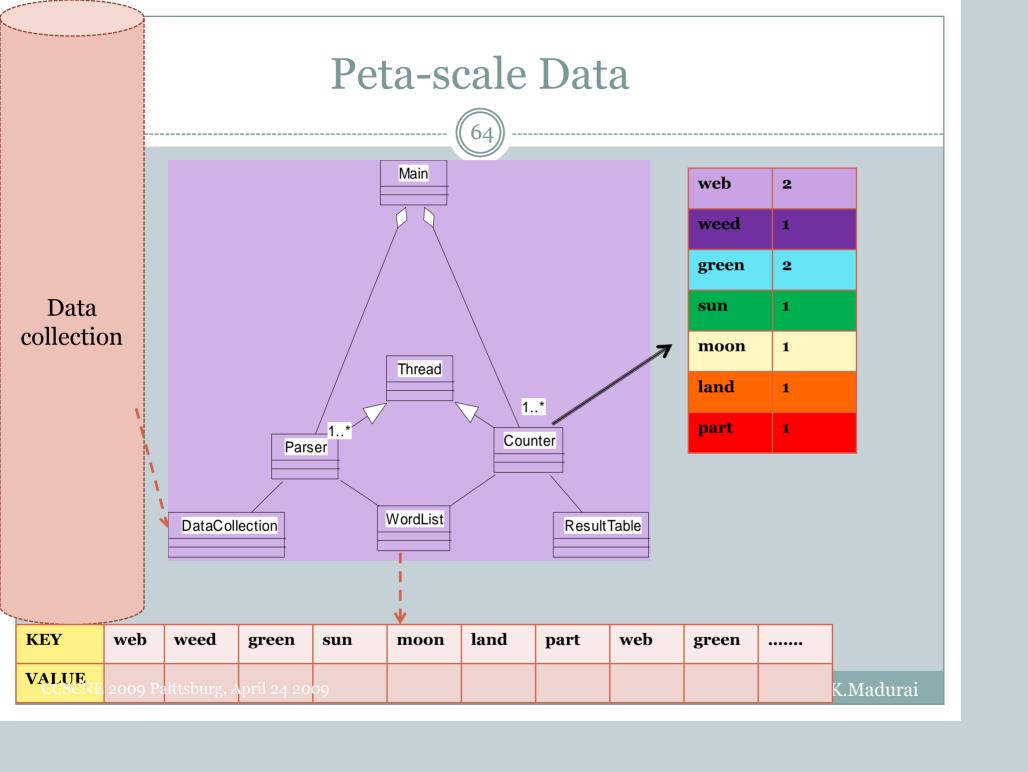

CCSCNE 2009 Palttsburg, April 24 2009

#### Word Counter and Result Table

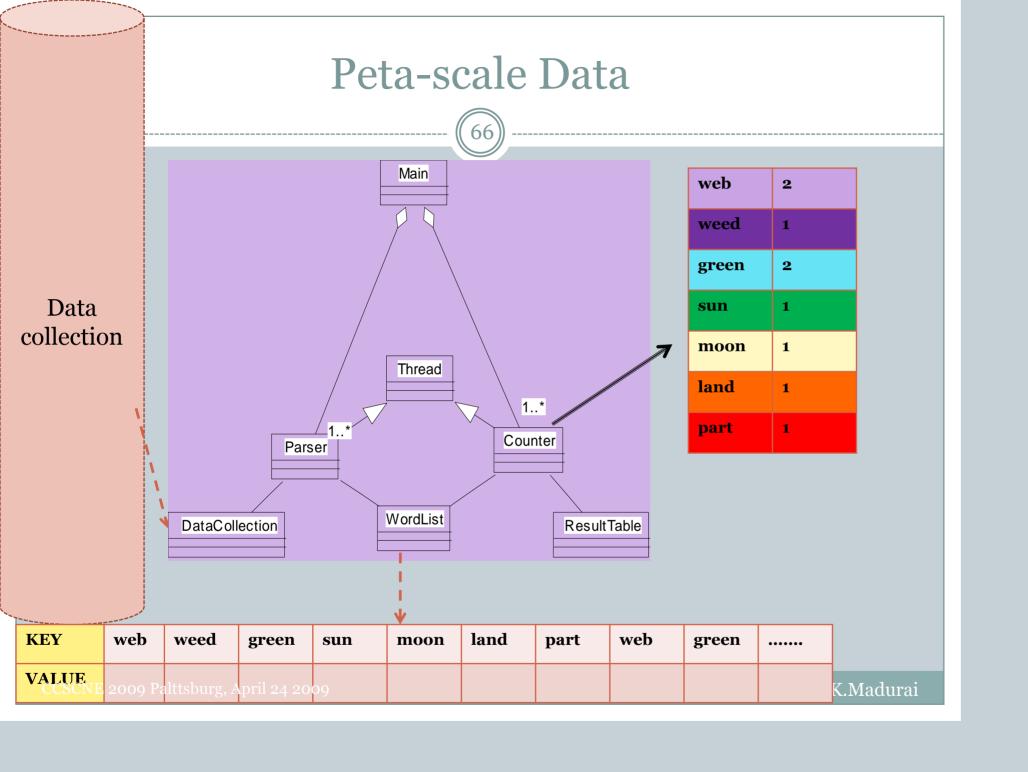

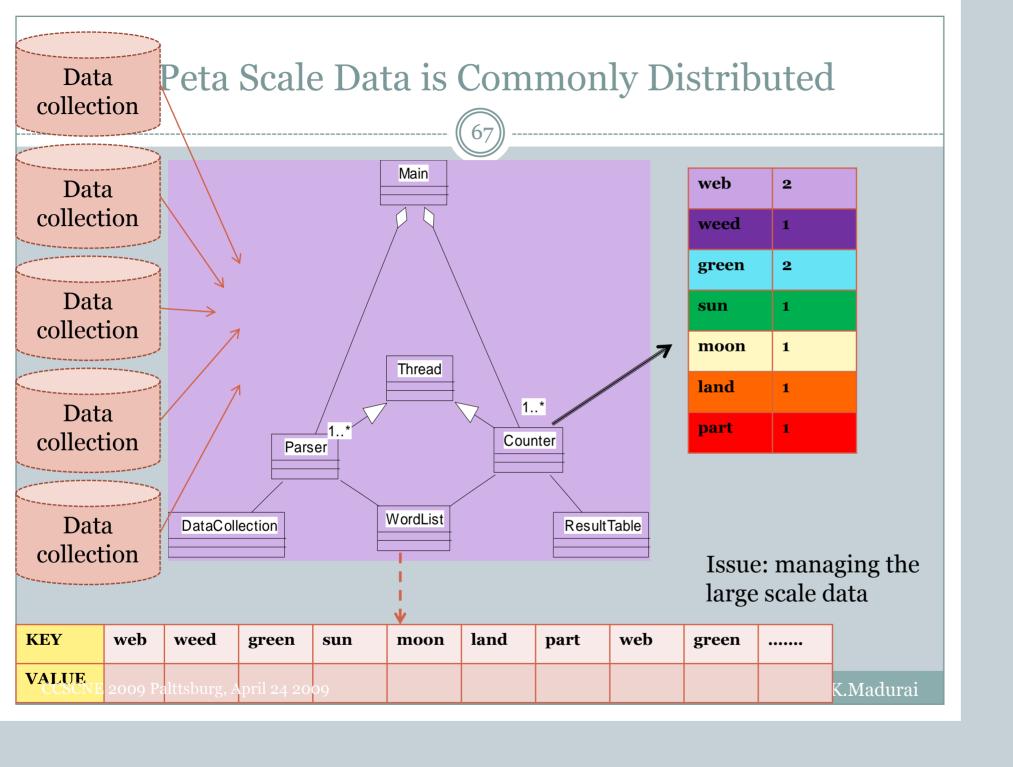

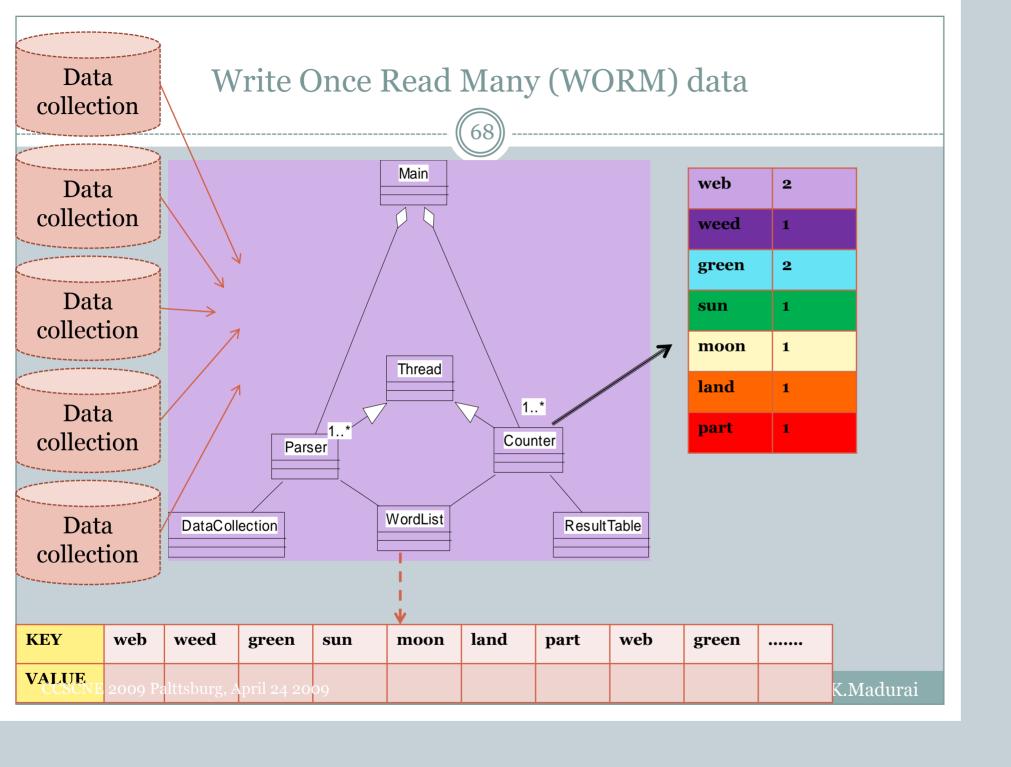

### Addressing the Scale Issue

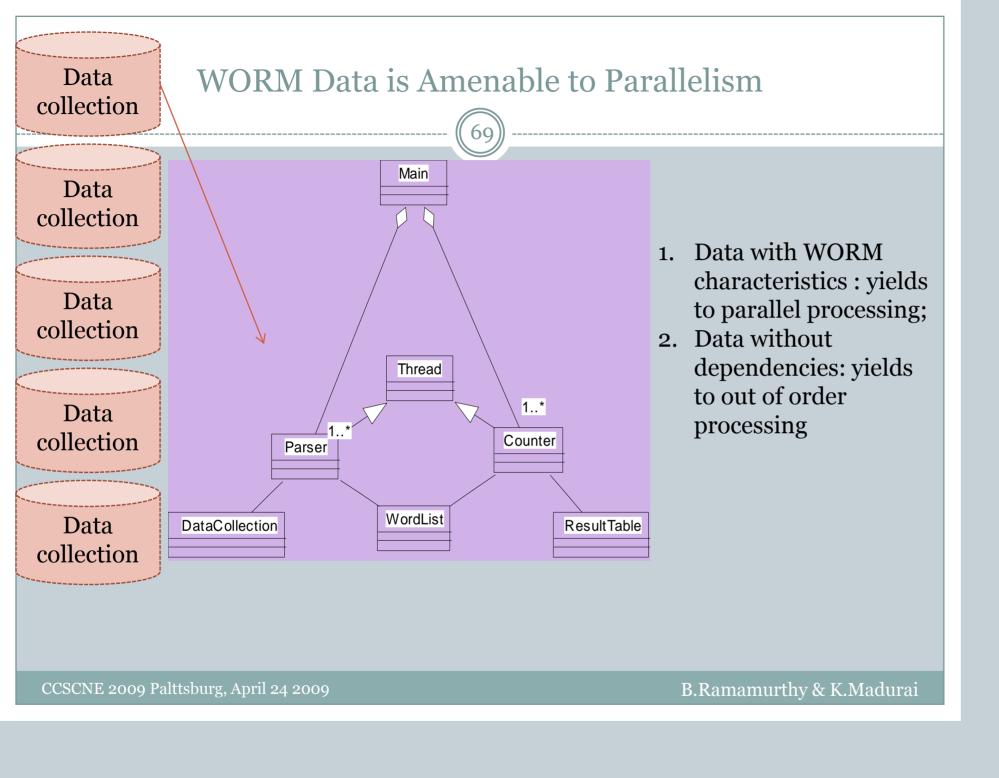

- Single machine cannot serve all the data: you need a distributed special (file) system
- Large number of commodity hardware disks: say, 1000 disks 1TB each
  - o Issue: With Mean time between failures (MTBF) or failure rate of 1/1000, then at least 1 of the above 1000 disks would be down at a given time.
  - Thus failure is norm and not an exception.
  - File system has to be fault-tolerant: replication, checksum
  - Data transfer bandwidth is critical (location of data)
- Critical aspects: fault tolerance + replication + load balancing, monitoring
- Exploit parallelism afforded by splitting parsing and counting
- Provision and locate computing at data locations

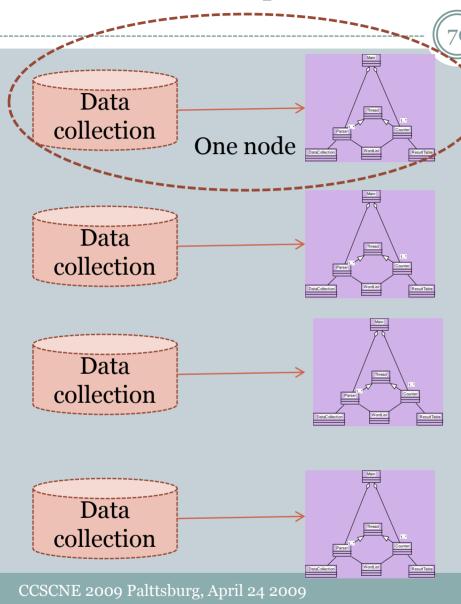

#### Divide and Conquer: Provision Computing at Data Location

For our example,

#1: Schedule parallel parse tasks

#2: Schedule parallel count tasks

This is a particular solution; Lets generalize it:

Our parse is a mapping operation:
MAP: input → <key, value> pairs

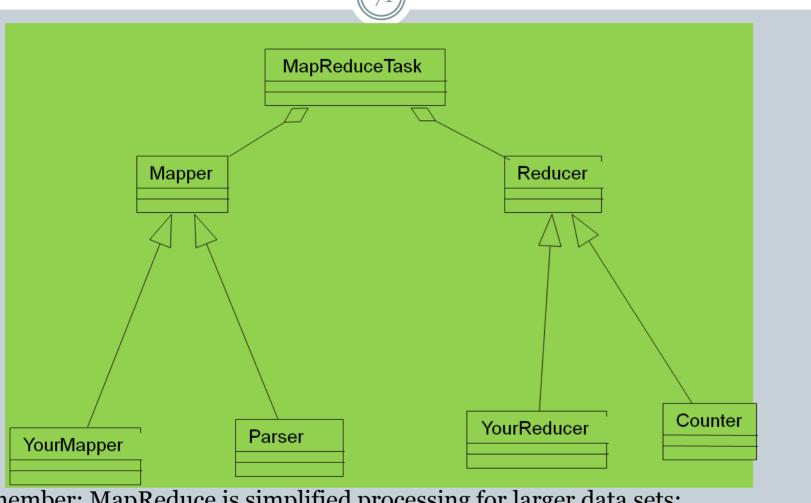

Our count is a reduce operation: REDUCE: <key, value> pairs reduced

Map/Reduce originated from Lisp But have different meaning here

Runtime adds distribution + fault tolerance + replication + monitoring + load balancing to your base application!

E 2009 Palttsburg, April 24 2009 B.Ramamurthy & K.Madurai

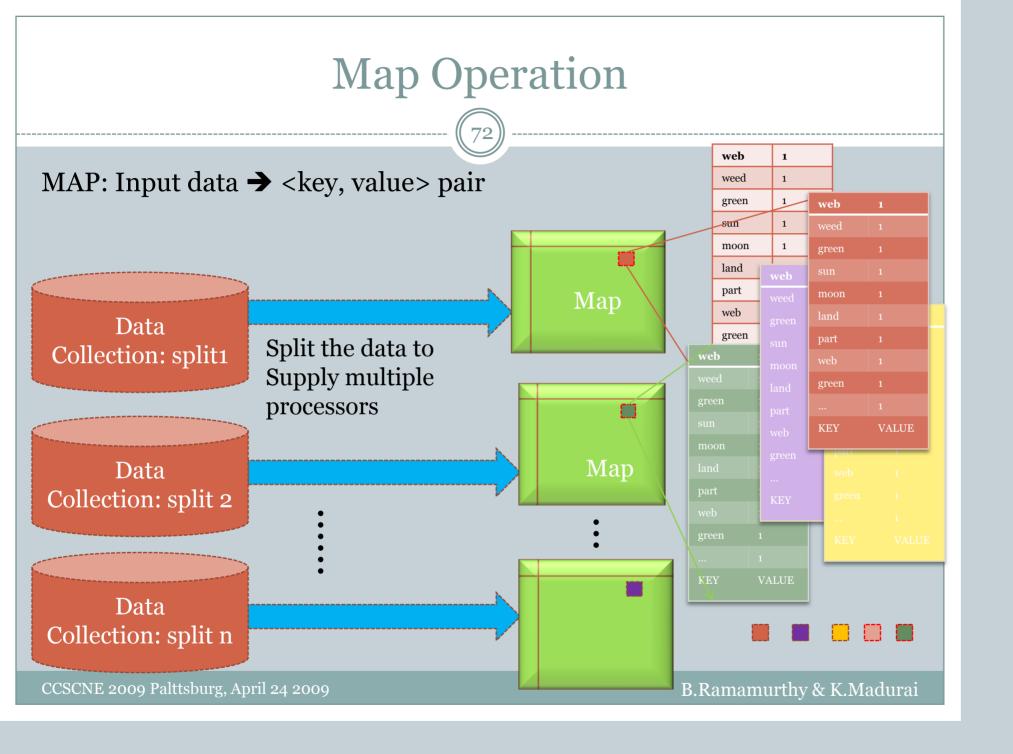

# Mapper and Reducer

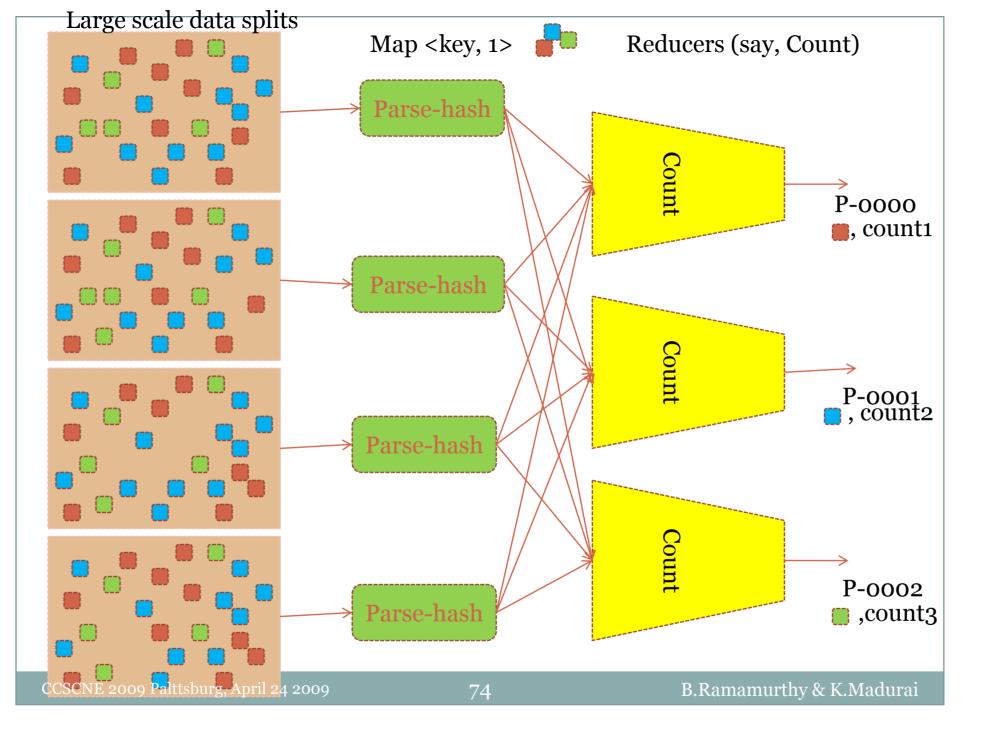

Remember: MapReduce is simplified processing for larger data sets:

MapReduce Version of WordCount Source code

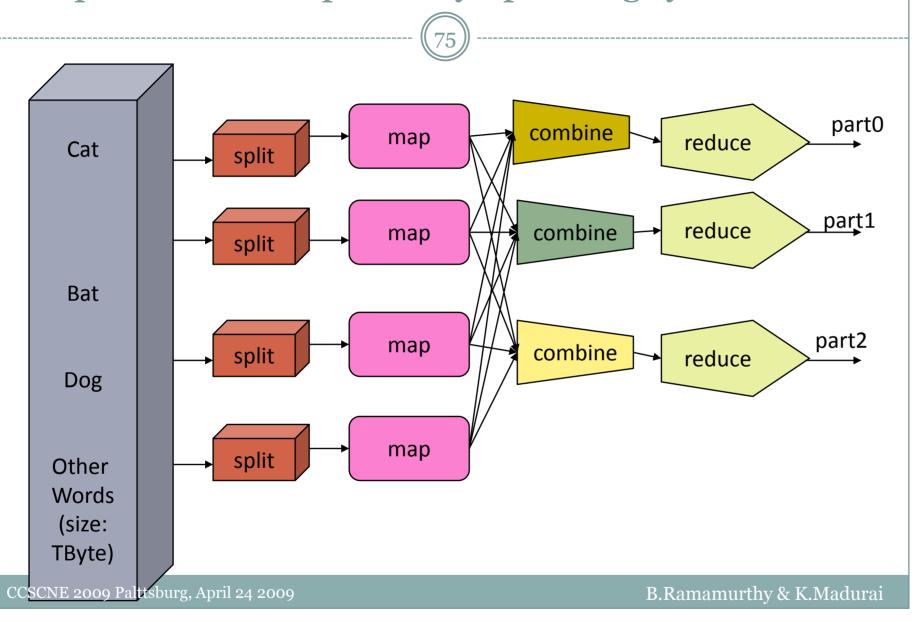

CCSCNE 2009 Palttsburg, April 24 2009

#### **Reduce Operation** MAP: Input data → <key, value> pair REDUCE: <key, value> pair → <result> Reduce Map Data Split the data to Collection: split1 Supply multiple processors Reduce Map Data Collection: split 2 Data Reduce Map Collection: split n CCSCNE 2009 Palttsburg, April 24 2009 B.Ramamurthy & K.Madurai

#### MapReduce Example in my operating systems class

# MapReduce Programming Model

(76)

### MapReduce programming model

- Determine if the problem is parallelizable and solvable using MapReduce (ex: Is the data WORM?, large data set).
- Design and implement solution as Mapper classes and Reducer class.
- Compile the source code with hadoop core.
- Package the code as jar executable.
- Configure the application (job) as to the number of mappers and reducers (tasks), input and output streams
- Load the data (or use it on previously available data)
- Launch the job and monitor.
- Study the result.
- <u>Detailed steps</u>.

### MapReduce Characteristics

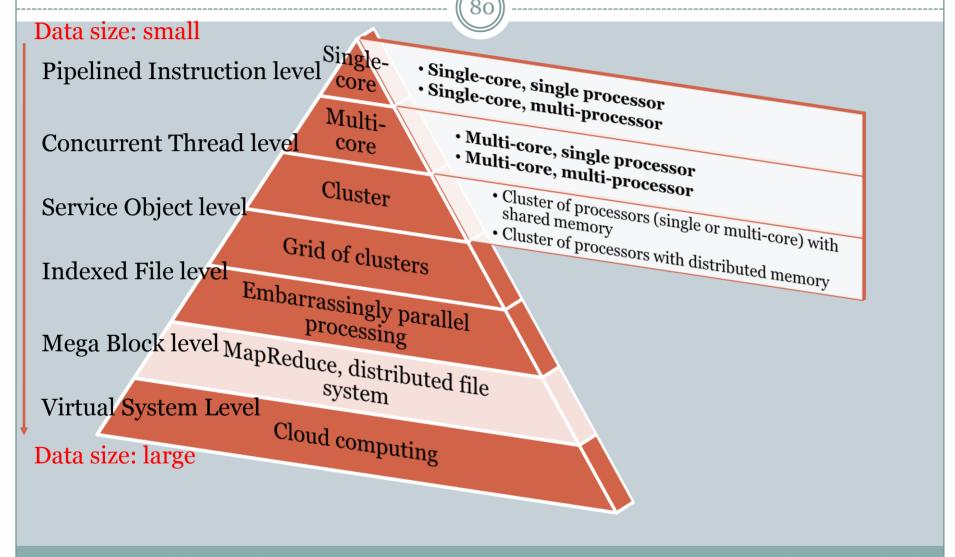

- Very large scale data: peta, exa bytes
- Write once and read many data: allows for parallelism without mutexes
- Map and Reduce are the main operations: simple code
- There are other supporting operations such as combine and partition (out of the scope of this talk).
- All the map should be completed before reduce operation starts.
- Map and reduce operations are typically performed by the same physical processor.
- Number of map tasks and reduce tasks are configurable.
- Operations are provisioned near the data.
- Commodity hardware and storage.
- Runtime takes care of splitting and moving data for operations.
- Special distributed file system. Example: Hadoop Distributed File System and Hadoop Runtime.

### Classes of problems "mapreducable"

- Benchmark for comparing: Jim Gray's challenge on dataintensive computing. Ex: "Sort"
- Google uses it (we think) for wordcount, adwords, pagerank, indexing data.
- Simple algorithms such as grep, text-indexing, reverse indexing
- Bayesian classification: data mining domain
- Facebook uses it for various operations: demographics
- Financial services use it for analytics
- Astronomy: Gaussian analysis for locating extra-terrestrial objects.
- Expected to play a critical role in semantic web and web3.0

# Scope of MapReduce

CCSCNE 2009 Palttsburg, April 24 2009

# Hadoop

81)

CCSCNE 2009 Palttsburg, April 24 2009

### What is Hadoop?

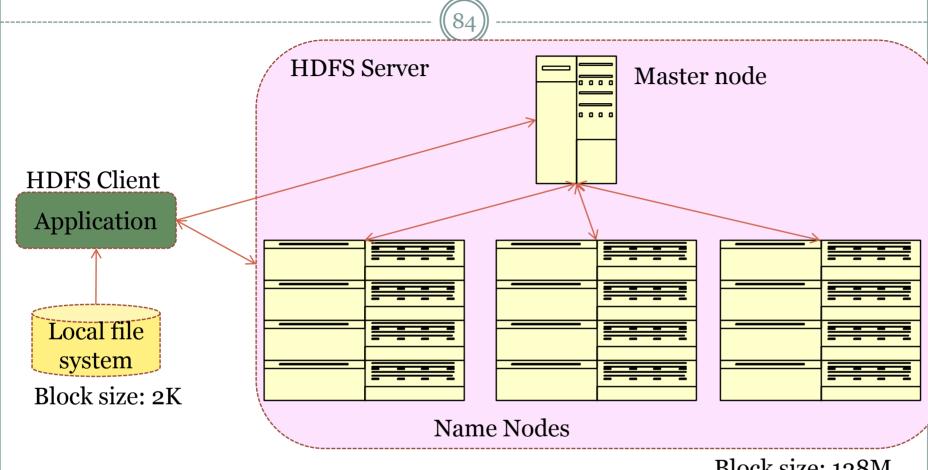

- (82)
- At Google MapReduce operation are run on a special file system called Google File System (GFS) that is highly optimized for this purpose.
- GFS is not open source.
- Doug Cutting and Yahoo! reverse engineered the GFS and called it Hadoop Distributed File System (HDFS).
- The software framework that supports HDFS, MapReduce and other related entities is called the project Hadoop or simply Hadoop.
- This is open source and distributed by Apache.

### **Basic Features: HDFS**

- 83
- Highly fault-tolerant
- High throughput
- Suitable for applications with large data sets
- Streaming access to file system data
- Can be built out of commodity hardware

CCSCNE 2009 Palttsburg, April 24 2009

### Hadoop Distributed File System

More details: We discuss this in great detail in my Operating

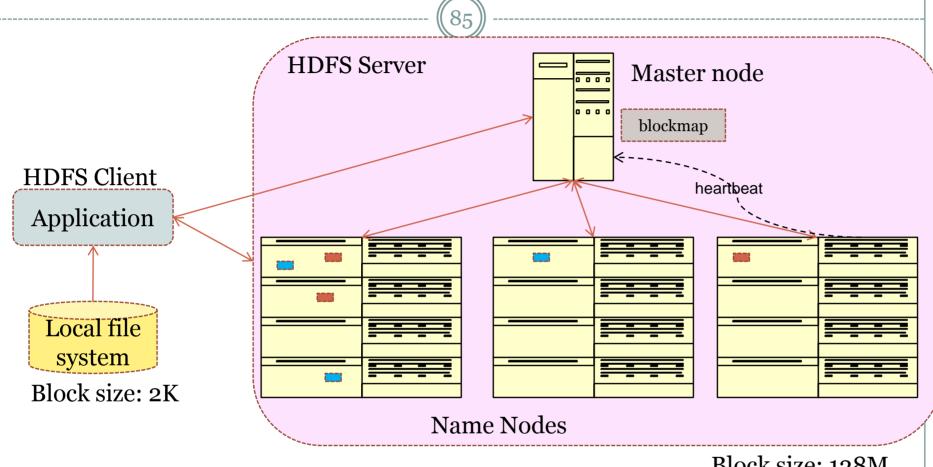

Systems course

Block size: 128M

Replicated

CCSCNE 2009 Palttsburg, April 24 2009

### Hadoop Distributed File System

More details: We discuss this in great detail in my Operating

Systems course

Block size: 128M Replicated

перпеиса

CCSCNE 2009 Palttsburg, April 24 2009

### Relevance and Impact on Undergraduate courses

- Data structures and algorithms: a new look at traditional algorithms such as sort: Quicksort may not be your choice! It is not easily parallelizable. Merge sort is better.
- You can identify mappers and reducers among your algorithms. Mappers and reducers are simply place holders for algorithms relevant for your applications.
- Large scale data and analytics are indeed concepts to reckon with similar to how we addressed "programming in the large" by OO concepts.
- While a full course on MR/HDFS may not be warranted, the concepts perhaps can be woven into most courses in our CS curriculum.

#### Demo

- VMware simulated Hadoop and MapReduce demo
- Remote access to NEXOS system at my Buffalo office
- 5-node HDFS running HDFS on Ubuntu 8.04
- 1 –name node and 4 data-nodes
- Each is an old commodity PC with 512 MB RAM,
   120GB 160GB external memory
- Zeus (namenode), datanodes: hermes, dionysus, aphrodite, athena

CCSCNE 2009 Palttsburg, April 24 2009

### Summary

- (88)
- We introduced MapReduce programming model for processing large scale data
- We discussed the supporting Hadoop Distributed
   File System
- The concepts were illustrated using a simple example
- We reviewed some important parts of the source code for the example.
- Relationship to Cloud Computing

CCSCNE 2009 Palttsburg, April 24 2009

Hive - SQL on top of Hadoop

# Map-Reduce and SQL

#### Map-Reduce is scalable

- SQL has a huge user base
- SQL is easy to code

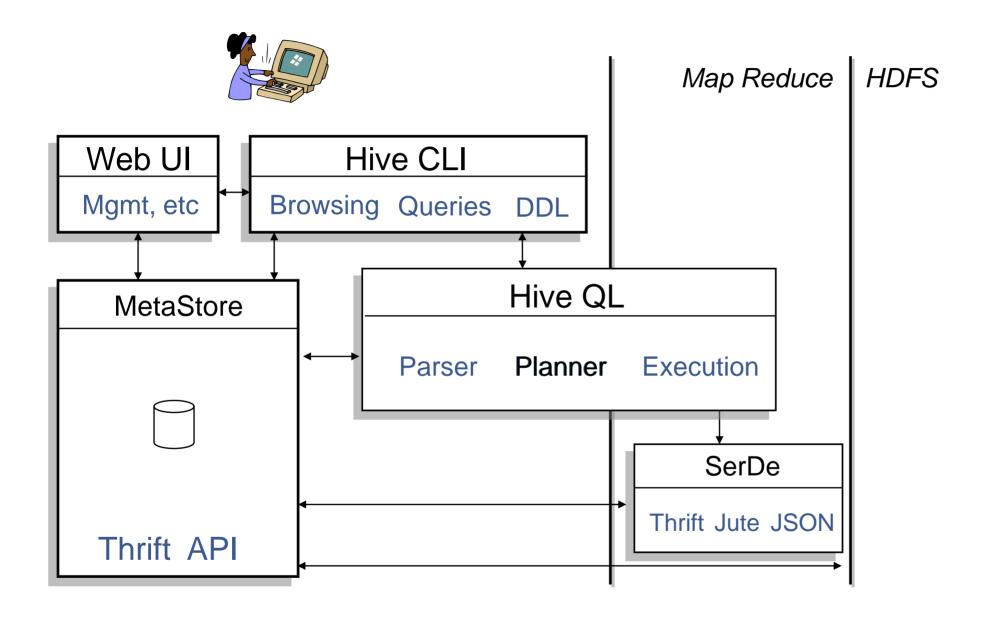

#### Solution: Combine SQL and Map-Reduce

- Hive on top of Hadoop (open source)
- Aster Data (proprietary)
- Green Plum (proprietary)

### Hive

- A database/data warehouse on top of Hadoop
  - Rich data types (structs, lists and maps)
  - Efficient implementations of SQL filters, joins and groupby's on top of map reduce
- Allow users to access Hive data without using Hive
- Link:
  - http://svn.apache.org/repos/asf/hadoop/hive/ trunk/

### **Hive Architecture**

### MetaStore

- Stores Table/Partition properties:
  - Table schema and SerDe library
  - Table Location on HDFS
  - Logical Partitioning keys and types
  - Other information
- Thrift API
  - Current clients in Php (Web Interface), Python (old CLI),
     Java (Query Engine and CLI), Perl (Tests)
- Metadata can be stored as text files or even in a SQL backend

### **Hive CLI**

- DDL:
  - create table/drop table/rename table
  - alter table add column
- Browsing:
  - show tables
  - describe table
  - cat table
- Loading Data
- Queries

### Web UI for Hive

#### MetaStore UI:

- Browse and navigate all tables in the system
- Comment on each table and each column
- Also captures data dependencies

#### HiPal:

- Interactively construct SQL queries by mouse clicks
- Support projection, filtering, group by and joining
- Also support

# Hive Query Language

- Philosophy
  - SQL
  - Map-Reduce with custom scripts (hadoop streaming)
- Query Operators
  - Projections
  - Equi-joins
  - Group by
  - Sampling
  - Order By

### Hive QL – Custom Map/Reduce Scripts

#### Extended SQL:

- FROM (
  - FROM pv\_users
  - MAP pv\_users.userid, pv\_users.date
  - **USING** 'map\_script' AS (dt, uid)
  - CLUSTER BY dt) map
- INSERT INTO TABLE pv\_users\_reduced
  - REDUCE map.dt, map.uid
  - **USING** 'reduce\_script' AS (date, count);
- Map-Reduce: similar to hadoop streaming
